Exercise 30, calculator

We got a calculator grammar.

Code listings

Listing 1: grammar.gr

```
1  %scanner "Scanner.h"
2
3  %token NUMBER
4
5  %left '+' '-'
6  %left '*' '/'
7  %right '$'
8
9  %%
10
11 input:
12   input line
13 |
14   // empty
15 ;
16
17 line:
18   '\n'
```

```
19  |
20    expr '\n'
21  |
22    error '\n'
23  ;
24
25  expr:
26    NUMBER
27  |
28    expr '+' expr
29  |
30    expr '-' expr
31  |
32    expr '*' expr
33  |
34    expr '/' expr
35  |
36    '-' expr %prec '$'
37  |
38    '$' expr
39  |
40    '(' expr ')'
41  ;
```

Exercise 31, conflicts

We fixed numerous conflicts.

First grammar

The first revision of the grammar solves the reduce/reduce conflicts that are caused by the `NUMBER` branches in the `expr` and `number` nonterminals. To solve this we removed the `expr` case because it is already represented in `number`.

```
1  %token NUMBER
2
3  %%
4
5  expr:
6      number
7  |
```

```
8       expr '+' expr
9   |
10      expr '-' expr
11  |
12    // empty
13  ;
14
15  number:
16      NUMBER
17  ;
```

Second grammar

In this grammar we also solved the shift/reduce conflicts which were caused because '+' and '-' have equal priority and no explicitly specified resolution for these types of conflicts. We set them to equal priority but reduce and not shift as is customary with these operators. Also to avoid very weird cases we modified the grammar a little.

```
1   %token NUMBER
2
3   %left '+' '-'
4
5   %%
6   expr:
7     exprpart
8   |
9     // empty
10  ;
11
12  exprpart:
13      number
14  |
15      exprpart '+' exprpart
16  |
17      exprpart '-' exprpart
18  ;
19
20  number:
21      NUMBER
```

```
;
```

Exercise 32, priorities

We added a new priority to a grammar.

Code listings

Listing 2: grammar.gr

```
%token NR

%left NOTEQUAL
%left '+'
%left '*'
%left '^'
%right '-'

%%

expr:
  NR
|
  '-' expr
|
  expr '+' expr
|
  expr '*' expr
|
  expr NOTEQUAL expr
|
  expr '^' expr
;
```

Exercise 35, separated lists

We fixed the list grammar so it does what we want it to, the right way this time.

Design

There are three kinds of list, plain, separated and empty. The types plain and separated have non-terminals but the empty list does not as this is not necessary. Each list can only have one token type in it which consists of `plain_(token)_seg` or `sep_(token)_seg` non-terminals that we made for each token. Tokens are reduced into the proper list `seg`ment at the start of the list. A program could maintain this structure in the grammar file, adding or removing rules for certain tokens.

Code listings

Listing 3: grammar.gr

```
%token WORD
%token INT
%token FLOAT

%scanner Scanner.h

%%

list:
  plain
|
  separated
|
  // empty
;

// Plain list

plain:
  plain_word_seg
|
  plain_int_seg
|
  plain_float_seg
;

plain_word_seg:
  plain_word_seg WORD
```

```
29 |
30   WORD
31 ;
32
33 plain_int_seg:
34   plain_int_seg INT
35 |
36   INT
37 ;
38
39 plain_float_seg:
40   plain_float_seg FLOAT
41 |
42   FLOAT
43 ;
44
45 // Separated list
46 separated:
47   sep_word_seg WORD
48 |
49   sep_int_seg INT
50 |
51   sep_float_seg FLOAT
52 ;
53
54 sep_word_seg:
55   sep_word_seg WORD ','
56 |
57   WORD ','
58 ;
59
60 sep_int_seg:
61   sep_int_seg INT ','
62 |
63   INT ','
64 ;
65
66 sep_float_seg:
67   sep_float_seg FLOAT ','
68 |
```

```
69    FLOAT ','
70  ;
```
